Key point: *The program can decide which statements to execute based on a condition.*

- The condition radius < **0** is a condition a Boolean condition. The condition radius < **0** has only two possible values **true** or **false**.

  ```java
  if (radius < 0) {
      System.out.println("Incorrect input");
  } else {
      double area = radius * radius * 3.14159;
      System.out.println("Area is " + area);
  }
  ```
