

Term	Discussion
<b>Control Word</b>	A set of signals that executes a microoperation.
<b>Microoperation</b>	A register transfer or other operation that the CPU can execute in a single clock cycle.
<b>Hardwired Control</b>	Directly connects the control lines to the actual machine instructions.
<b>Microprogrammed Control</b>	Employs software consisting of microinstructions that carry out an instruction's microoperations.

#### 4.13.2 Hardwired Control

Bus Address	Component
0	Memory
1	MAR
2	PC
3	MBR
4	AC
5	InReg
6	OutReg
7	IR

Destination			Origin		
IR			MAR		
7			1		
P <sub>5</sub>	P <sub>4</sub>	P <sub>3</sub>	P <sub>2</sub>	P <sub>1</sub>	P <sub>0</sub>
1	1	1	0	0	1

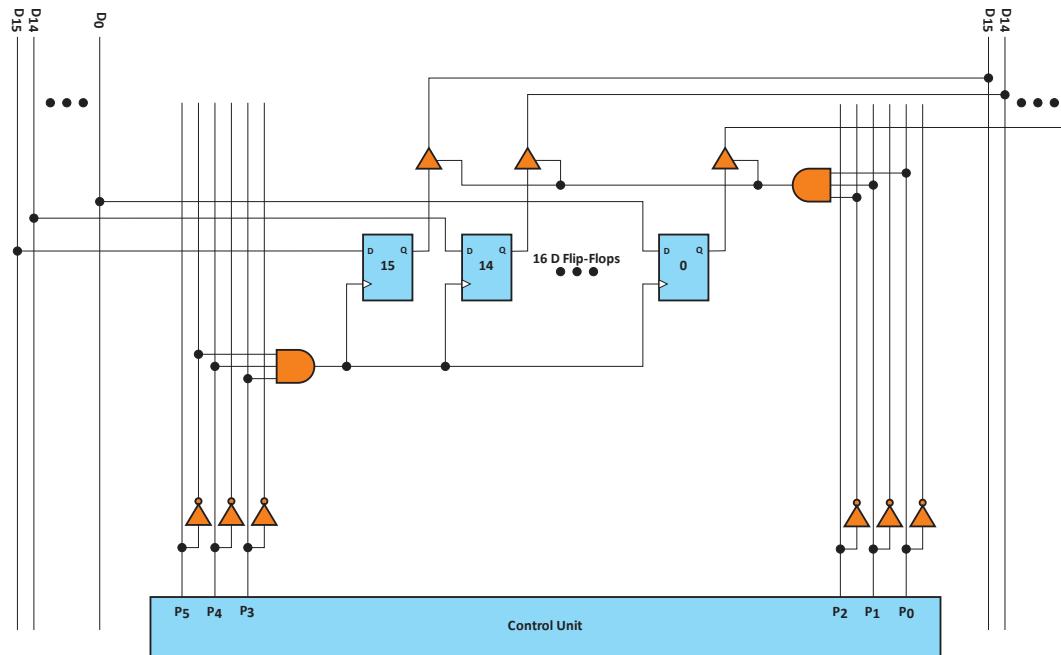

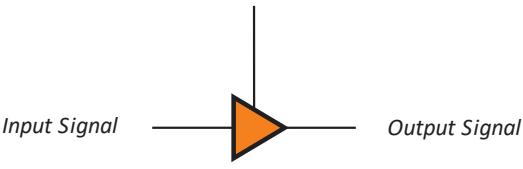

Figure 4.15 Connection of MARIE's MBR to the Datapath

Device	Operation
<p>Switch 0=Off 1=On</p> 	<p>Tri-state device:</p> <ul style="list-style-type: none"> <li>• If the switch is off, then the input signal is <b>NOT</b> transmitted to the output signal.</li> <li>• If the switch is on, then the input signal <b>IS</b> transmitted to the output signal.</li> </ul>
	<p>Inverter:</p> <ul style="list-style-type: none"> <li>• If <math>x = 0</math>, then <math>\bar{x} = 1</math></li> <li>• If <math>x = 1</math>, then <math>\bar{x} = 0</math></li> </ul>

- The set of signals  $\{P_2, P_1, P_0\}$  are assigned to **read** values put on the data bus.
- The set of signals  $\{P_5, P_4, P_3\}$  are assigned to **write** values to the data bus.
- Please note that a signal has a default value of 0. The significance of this feature is that to make the hypothetical transfer  $IR \leftarrow MAR$ , we need only assign  $[P_5, P_4, P_3] \leftarrow 111$  (7) and  $[P_2, P_1, P_0] \leftarrow 001$  (1). However, in practice, we only assign  $P_0 \leftarrow 1$ , because the other signals  $P_2$  and  $P_1$  are, by default, zero (0).
- We can imagine sets of D-Flip-Flops for the other registers MAR, PC, AC, InREG, and OutReg.

Bus Address	Device
0	Main Memory
1	MAR
2	PC
3	MBR
4	AC
5	InReg
6	OutReg
7	IR

MARIE's Datapath Addresses

ALU Control Signals		ALU Response
$A_1$	$A_0$	
0	0	Do Nothing
0	1	$AC \leftarrow AC + MBR$
1	0	$AC \leftarrow AC - MBR$
1	1	$AC \leftarrow 0$ (Clear)

Table 4.8 ALU Control Signals and Response

$L_{ALT}$	Action
0	Load the AC from the Data bus Load the MBR from the Data bus
1	Load the AC from the ALU Load the MBR from the AC

$M_R$	$M_W$	Action
0	0	Do Nothing
0	1	Memory Write Enable
1	0	Memory Read Enable
1	1	(Impossible)

$I_{PC}$	Action
0	Do Nothing
1	$PC \leftarrow PC + 1$

$T_0$	$Q_0$	$T_1$	$Q_1$	$T_2$	$Q_2$	$T_3$	$Q_3$	$T_4$
1	0	0	0	0	0	0	0	0
0	1	1	0	0	0	0	0	0
0	0	0	1	1	0	0	0	0
0	0	0	0	0	1	1	0	0
0	0	0	0	0	0	0	1	1
1	0	0	0	0	0	0	0	0

- Text asserts seven clock cycles,  $T_0 - T_6$ , are needed. Find the longest instruction, JnS.

- Including the clock cycles needed to fetch an instruction, ten clock cycles are needed,  $T_0$  –  $T_9$ .

Add X		
Control Signals	RTN	Comment
$T_0 P_3 P_1$	$MAR \leftarrow PC$	Fetch
$T_1 P_5 P_4 P_3 M_R$	$IR \leftarrow M[MAR]$	
$T_2 I_{PC}$	$PC \leftarrow PC + 1$	
$T_3 P_3 P_2 P_1 P_0$	$MAR \leftarrow X(IR[11 - 0])$	Decode
$T_4 P_4 P_3 M_R$	$MBR \leftarrow M[MAR]$	Execute
$T_5 P_5 A_0 L_{ALT} C_R$	$AC \leftarrow AC + MBR$

#### 4.13.3 Microprogrammed Control

- In microprogrammed control, instruction **microcode** produces the necessary control signals.

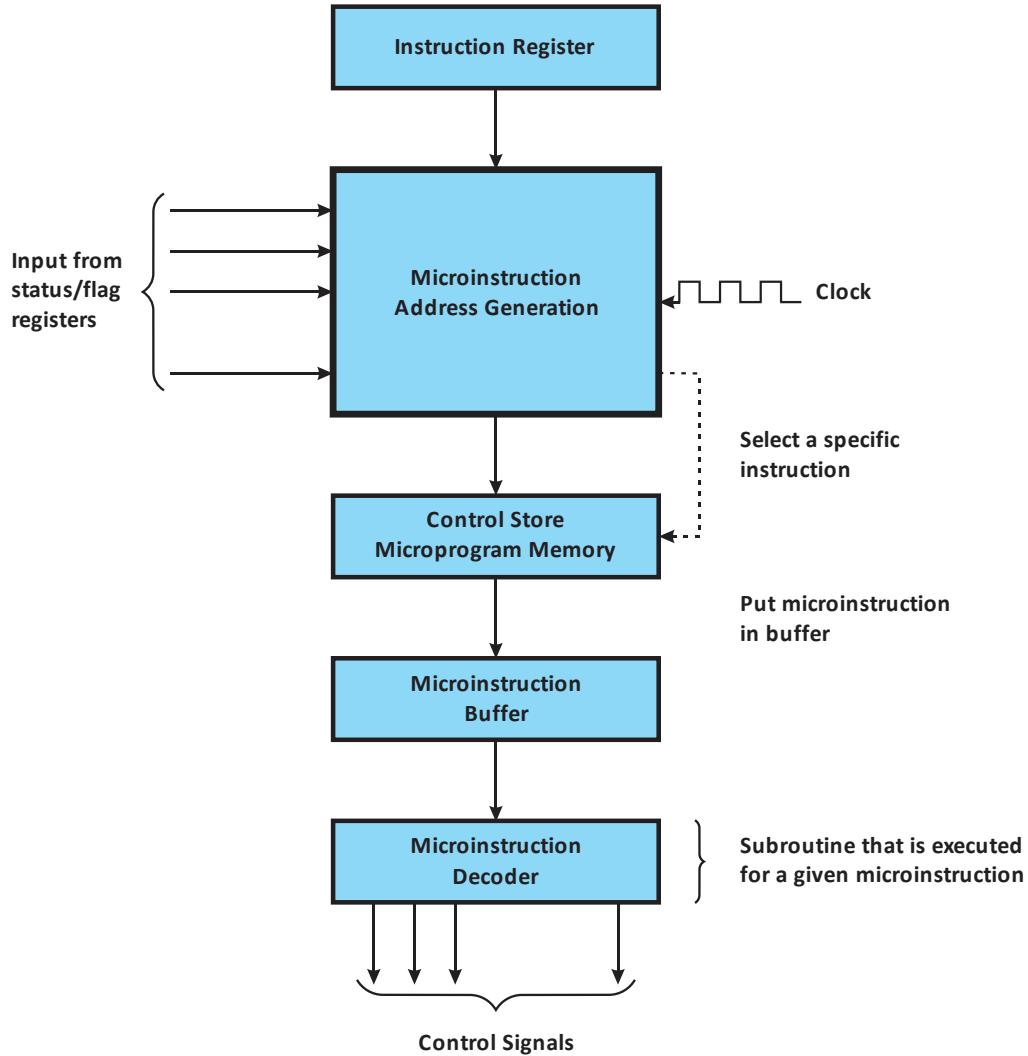

Figure 4.21 Microprogrammed Control Unit

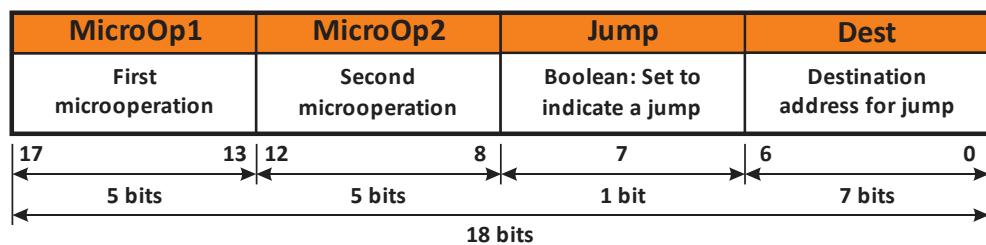

Figure 4.22 MARIE's Microinstruction Format

- All machine instructions are input into a special program, the **microprogram**, that converts machine instructions of 0s and 1s into control signals.

- The microprogram is, essentially, an interpreter, written in microcode, that is stored in **firmware** (ROM, PROM, or EPROM), which is often referred to as the control store.
- The **microsequencer** is like the program counter that selects the next microinstruction to execute.
- MicroOp1 and MicroOp2 are binary codes for each unique microoperation specified in the RTN for MARIE's instruction set.
- So far, we have defined 22 unique microoperations.
- We need a NOP – no operation microcode.
- We need a comparison microoperation that compares the bit pattern in the first 4 bits of the instruction register (IR[14-12]) to a literal value that is in the first 4 bits of the MicroOp2 field.
- MARIE's entire microprogram consists of fewer than 128 statements, so each statement can be uniquely identified by seven (7) bits. Each microinstruction has a seven-bit address.

MicroOp Code	Microoperation	MicroOp Code	Microoperation
00000	NOP	01101	MBR $\leftarrow$ M[MAR]
00001	AC $\leftarrow$ 0	01110	OutREG $\leftarrow$ AC
00010	AC $\leftarrow$ MBR	01111	PC $\leftarrow$ IR[11 – 0]
00011	AC $\leftarrow$ AC - MBR	10000	PC $\leftarrow$ MBR
00100	AC $\leftarrow$ AC + MBR	10001	PC $\leftarrow$ PC + 1
00101	AC $\leftarrow$ InREG	10010	If AC = 0
00110	IR $\leftarrow$ M[MAR]	10011	If AC > 0
00111	M[MAR] $\leftarrow$ MBR	10100	If AC < 0
01000	MAR $\leftarrow$ IR[11 - 0]	10101	If IR[11 – 10] = 00
01001	MAR $\leftarrow$ MBR	10110	If IR[11 – 10] = 01
01010	MAR $\leftarrow$ PC	10111	If IR[11 – 10] = 10
01011	MAR $\leftarrow$ X	11000	If IR[15 – 12] = MicroOp2[4 – 1]
01100	MBR $\leftarrow$ AC		

Table 4.9 Microoperation Codes and Corresponding MARIE RTL

Address	MicroOp1	MicroOp2	Jump	Dest
000 0000	$\text{MAR} \leftarrow \text{PC}$	NOP	0	000 0000
000 0001	$\text{IR} \leftarrow \text{M}[\text{MAR}]$	NOP	0	000 0000

FIGURE 4.23 Selected Statements in MARIE's Microprogram

- It's important to remember that a microprogrammed control unit works like a system-in-miniature.
- Microinstructions are fetched, decoded, and executed in the same manner as regular instructions.
- This extra level of instruction interpretation is what makes microprogrammed control slower than hardwired control.
- The advantages of microprogrammed control are that it can support very complicated instructions and only the microprogram needs to be changed if the instruction set changes (or an error is found).
